Engineered (Artificial) Stone An Unacceptable Hazard!

March 30, 5:00 p.m. EDT; March 31, 8:00 a.m. AEDT

Workers in many countries are getting seriously ill from working with engineered (artificial) stone. In response, Australia banned engineered stone countertops with more than 1% crystalline silica. Join our WHWB webinar where Professor Deborah Glass from Monash University in Australia will provide compelling evidence linking job exposure patterns with increased risk of respiratory disease among workers exposed to respirable crystalline silica (RCS) from engineered stone. This research provided an important evidence base for Australia's ban.
